

AUTO-VOD EDITOR

User Manual & Configuration Guide (Beta v2)

Welcome to the **Auto-VOD Editor**. Behind this dashboard is an AI-driven, multiprocessing acoustic engine that physically listens to your gameplay, your voice, and your word choice to automatically edit your streams into three clean formats:

- **Trimmed VOD:** Cuts the dead air and boring parts, keeping the narrative alive.
- **Highlight Reel:** A densely packed compilation of only the absolute highest-energy moments.
- **YouTube Shorts:** Extracts your best clips perfectly cut to strict duration limits (**120 to 180 seconds**), bypassing short noise anomalies and ensuring only sustained combat is exported. Ready for you to drop into Premiere and frame vertically.

Below is a guide on how to tune the sliders to match the specific "vibe" of the VOD you are processing.

1. VOD Trimming Logic

This section acts as your "Director." It controls how much boring footage is deleted.

VIP Keep Base Score (The Floor)

What it does: The engine scores every 3 seconds of your VOD. If a moment fails to reach this number, it is instantly deleted.

How to tune it: Set this to 7 or 8 for a normal, chatty stream. Set this to 2 or 4 for a "silent/solo" horror game stream where you only want it to delete true, dead silence.

Target VOD Ratio (%)

What it does: The maximum percentage of the original video you want to keep.

How to tune it: If you stream for 4 hours and set this to 0.70, the engine will output a beautifully paced Trimmed VOD that is no longer than 2.8 hours. It will intelligently prioritize the highest-scoring segments to fit within this ratio.

2. Highlights & Thumbnails

Highlight Max Minutes

What it does: Sets a hard cap on the duration of your Highlight Reel.

How to tune it: Set to 60 for a massive "Best of the Month" compilation. Set to 15 if you want a punchy, YouTube-ready recap of the session.

Thumbnail Spread (sec)

What it does: The engine finds the mathematical "climax" of each exported Short and extracts physical JPG frames for you to use in Photoshop. Spread determines how many seconds before/after that center peak it should take photos. *(Note: The engine automatically extracts 3 frames per generated Short).*

3. Vocab & Bookmarks

Bookmark Codeword

What it does: A word you can say on stream (e.g., "Pineapple") that acts as a manual override. Even if the moment is boring, saying this word forces the engine to save the clip and inject it into the Highlight Reel.

Hype Words

What it does: A comma-separated list of phrases you say when excited. The engine transcribes your voice; if it detects these words, the clip's score violently spikes via the internal Hype Multiplier. Update this to match your personal gamer vocabulary!

4. Shorts Generator

Number of Shorts to Export

What it does: The engine takes the absolute highest-scoring, most chaotic firefights from the entire VOD and exports them as standalone video files. These files pass through an "Anomaly Shield" ensuring a minimum of **120s** (to ignore dropped items or random noise) and a maximum of **180s** duration limits.

How to tune it: Set it to 0 to completely disable the Shorts generator, or scale it up to 20 if you want a massive backlog of raw content to edit later.
